

LY-A11VO/10系列变量柱塞泵

Variable Displacement Piston Pump LY-A11VO/10

概述 Overview

LY-A11VSO/10系列变量柱塞泵均为斜盘式轴向柱塞变量泵，分别为工业用和行走机械用设计，都是专为开式回路液压驱动设计的，采用通轴结构，额定工作压力可达35MPa。

LY-A11V(S)O/10 series variable displacement piston pump swash plate axial plunger variable pump, respectively for industrial use and for mobile machinery design, is designed for open loop hydraulic driven design, adopts a shaft structure, rated working pressure up to 35Mpa.

特点

- ※ 斜盘结构轴向柱塞变量泵，用于开式回路液压系统中的静液压传动。
- ※ 主要为行走作业机械应用而设计。
- ※ 在油箱加压或使用选装内置注油泵(叶轮)的条件下，泵在自动起动注油状态下操作。
- ※ 提供满足各种应用要求的各种控制选装件。
- ※ 功率控制选装件在外部可调，即使当泵运行时也能进行。
- ※ 通轴驱动适合加入的齿轮泵和轴向柱塞泵。
- ※ 输出流量与驱动速度成比例并且可以在 $q_{v \max}$ 和 $q_{v \min}=0$ 之间无级变化。

Features

- ※ Variable pump with axial piston rotary group of swash-plate design for hydrostatic drives in open circuit.
- ※ Designed primarily for the use of walking machines.
- ※ When the mailbox is pressurized or when an optional built-in impeller is used The pump is operated under the condition of automatic start-up and oil injection.
- ※ Provide a variety of optional control parts to meet the requirements of various applications.
- ※ Power control optional parts are externally adjustable, even when the pump is running.
- ※ Through shaft drive is suitable for adding gear pump and axial piston pump.
- ※ The output flow rate is proportional to the driving speed and can vary freely between $q_{v \max}$ and $q_{v \min}=0$

扭矩分布 Torque Distribution

确定公称值

$$\text{流量 } q_v = \frac{V_g \cdot n \cdot \eta_v}{1000} \text{ l/min}$$

$$\text{扭矩 } T = \frac{V_g \cdot \Delta p}{20 \cdot \pi \cdot \eta_{mh}} \text{ Nm}$$

$$\text{功率 } P = \frac{2 \pi \cdot T \cdot n}{60,000} = \frac{q_v \cdot \Delta p}{600 \cdot \eta_t} \text{ kW}$$

V_g = 每转排量 (cm³)

Δp = 压差 (bar)

n = 转速 (rpm)

η_v = 容积效率

η_{mh} = 机械 - 液压效率

η_t = 总效率 ($\eta_t = \eta_v \cdot \eta_{mh}$)

LR- 功率控制 Power Control

功率控制器根据工作压力调节泵的排量，从而在恒定传动速度下不会超过规定的驱动功率。

The power control regulates the displacement of the pump depending on the operating pressure so that a given drive power is not exceeded at constant drive speed.

$$p_B \cdot V_g = \text{常数 Constant}$$

p_B = 工作压力 operating pressure

V_g = 排量 displacement

使用双曲线特性的精确控制能够实现可用功率的最佳利用。

The precise control with a hyperbolic control characteristic, provides an optimum utilization of available power.

工作压力通过测量活塞作用于摇杆。外部可调的弹簧力与此相抵消，它决定功率设置。

The operating pressure acts on a rocker via a measuring piston. An externally adjustable spring force counteracts this, it determines the power setting.

如果工作压力超过弹簧的设置力，摇杆驱动控制阀且泵转回(朝向 $V_g \min$)。摇杆长度缩短，工作压力的增加量与排量的降低量相同，同时不会超过驱动功率($p_B \cdot V_g$ = 常数)。

If the operating pressure exceeds the set spring force, the control valve is actuated by the rocker, the pump swivels back (direction $V_g \min$). The lever length at the rocker is shortened and the operating pressure can increase at the same rate as the displacement decreases without the drive powers being exceeded ($p_B \cdot V_g$ = constant).

液压输出功率(LR特性)受泵效率的影响。

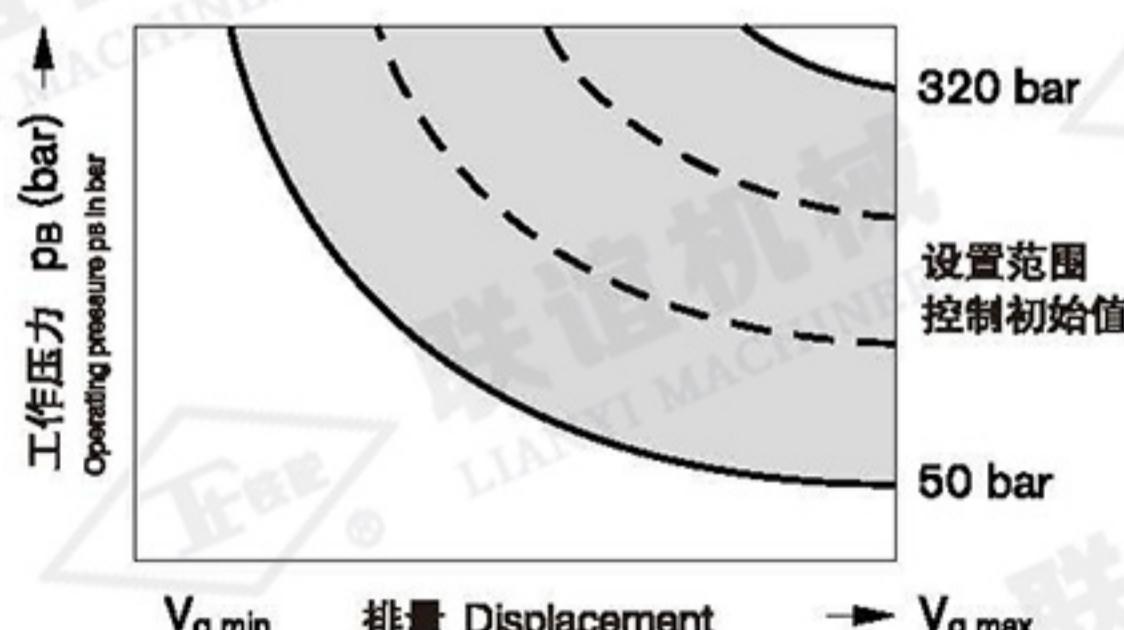

The hydraulic output power (characteristic LR) is influenced by the efficiency of the pump.

按顺序用明文说明 State in clear text in the order:

- 驱动功率 P (kW) – drive power P in kW
- 传动速度 n (rpm) – drive speed n in rpm
- 最大流量 qv max (l/min) – max. flow qv max in l/min

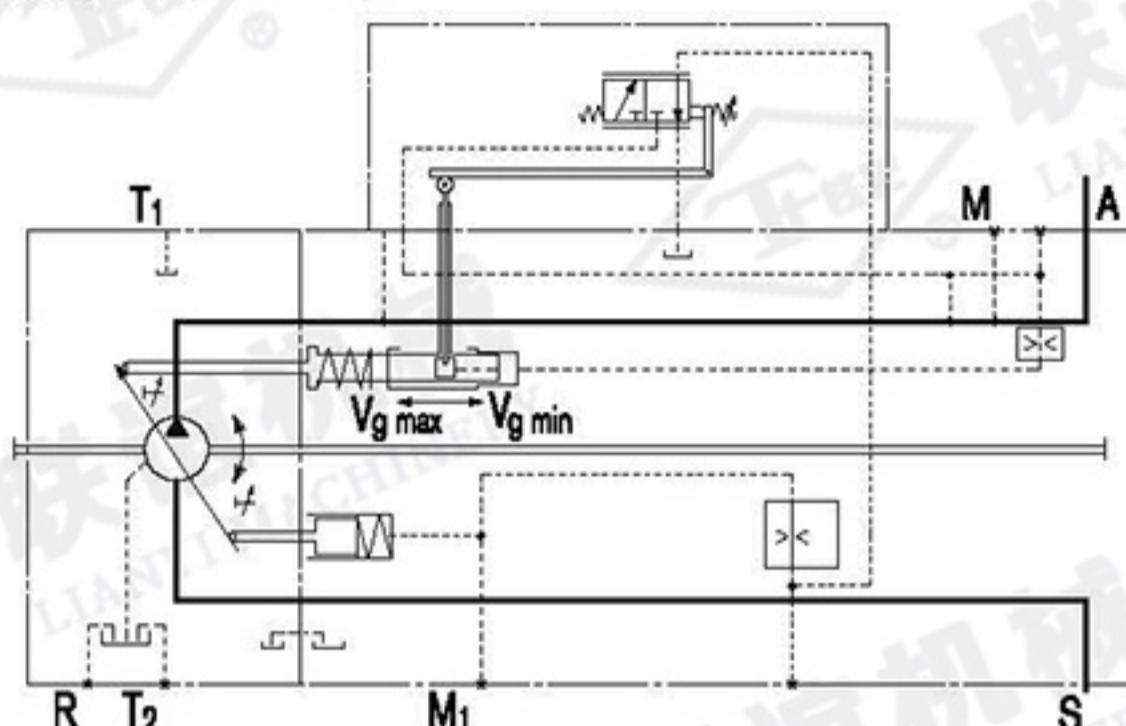

注明详细要求后，我们的电脑可生成功率图。

After clarifying the details a power diagram can be created by our computer.

规格 Size 190……260

LR- 功率控制 Power Control

LRD 带有压力切斷的功率控制 LRD Power control with pressure cut-off

当达到压力设置时，压力切斷对应将泵排量调节回 $V_{g \min}$ 的压力控制。

The pressure cut-off corresponds to a pressure control which adjusts the pump displacement back to $V_{g \min}$, when the pressure setting is reached.

该功能越权控制功率控制，即低于预置压力值时，功率功能生效。

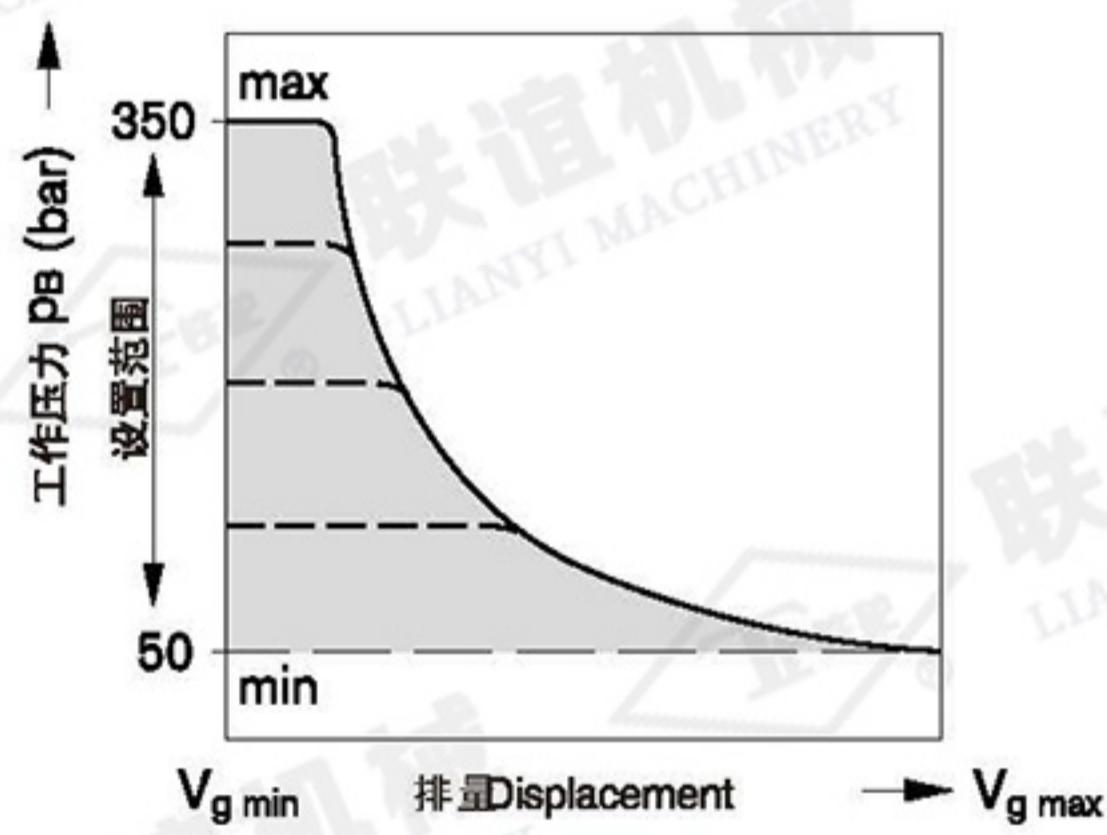

This function overrides the power control, i.e. below the preset pressure value, the power function is effective.

压力切斷功能集成在泵控制模块中，并在出厂前预置到规定值。

The pressure cut-off function is integrated into the pump control module and is preset to a specified value at the factory.

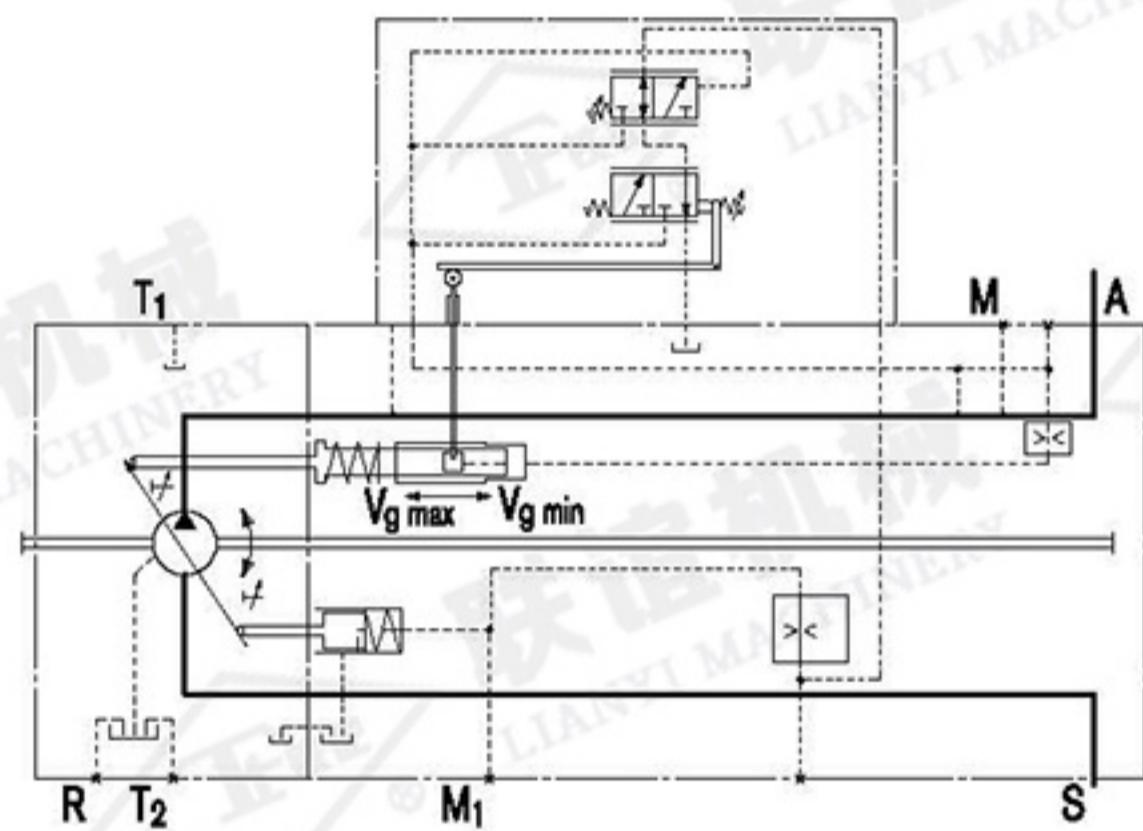

设置范围从 50 到 350 bar Setting range from 50 to 350 bar

LRD 特性 Characteristic LRD

規格 SIZE 40.....145

規格 SIZE 190.....260

LR- 功率控制 Power Control

LRDS 带有压力切断和负载感应的功率控制

LRDS Power control with pressure cut-off and load sensing

负载感应控制器是一个作为负载压力函数运行的流量控制元件，以根据执行机构流量需求调节泵排量。

The load sensing control is a flow control option that operates as a function of the load pressure to regulate the pump displacement to match the actuator flow requirement.

该流量取决于安装在泵出口和执行机构之间的外部感应节流孔(1)的横截面。该流量与低于功率曲线和压力切断设置以及泵控制范围内的负载压力无关。

The flow depends here on the cross section of the external sensing orifice (1) fitted between the pump outlet and the actuator. The flow is independent of the load pressure below the power curve and the pressure cut-off setting and within the control range of the pump.

感应节流孔通常为一个单独布置的负载感应方向阀(控制块)方向阀活塞的位置决定了感应节流孔的开口横截面，从而决定了泵的流量。

The sensing orifice is usually a separately arranged load sensing directional valve (control block). The position of the directional valve piston determines the opening cross section of the sensing orifice and thus the flow of the pump.

负载感应控制比较感应节流孔前后的压力，并维持通过孔的压降(压差 Δp)，从而使泵流量保持恒定。

The load sensing control compares pressure before and after the sensing orifice and maintains the pressure drop across the orifice (differential pressure Δp) and with it the pump flow constant.

如果感应孔处的压差 Δp 增大，泵则转回(朝向 $V_{g \min}$)，而如果压差 Δp 减小，则泵转出(朝向 $V_{g \max}$)，直到阀内感应孔上的压降恢复。

If the differential pressure Δp increases at the sensing orifice, the pump is swivelled back (towards $V_{g \min}$), and, if the differential pressure Δp decreases, the pump is swivelled out (towards $V_{g \max}$) until the pressure drop across the sensing orifice in the valve is restored.

$$\Delta p_{\text{孔}} = p_{\text{泵}} - p_{\text{执行器}} \quad \Delta p_{\text{孔口}} = p_{\text{泵}} - p_{\text{执行器}}$$

Δp 的设置范围在 14 bar 和 25 bar 之间。

The setting range for Δp is between 14 bar and 25 bar.

标准压差设置为 18 bar。(订购时，请以明文形式注明)。

The standard differential pressure setting is 18 bar. (Please state in clear text when ordering).

零行程运行(感应节流孔堵上)时的备用压力略高于 Δp 设置值。

The stand-by pressure in zero stroke operation (sensing orifice plugged) is slightly above the Δp setting.

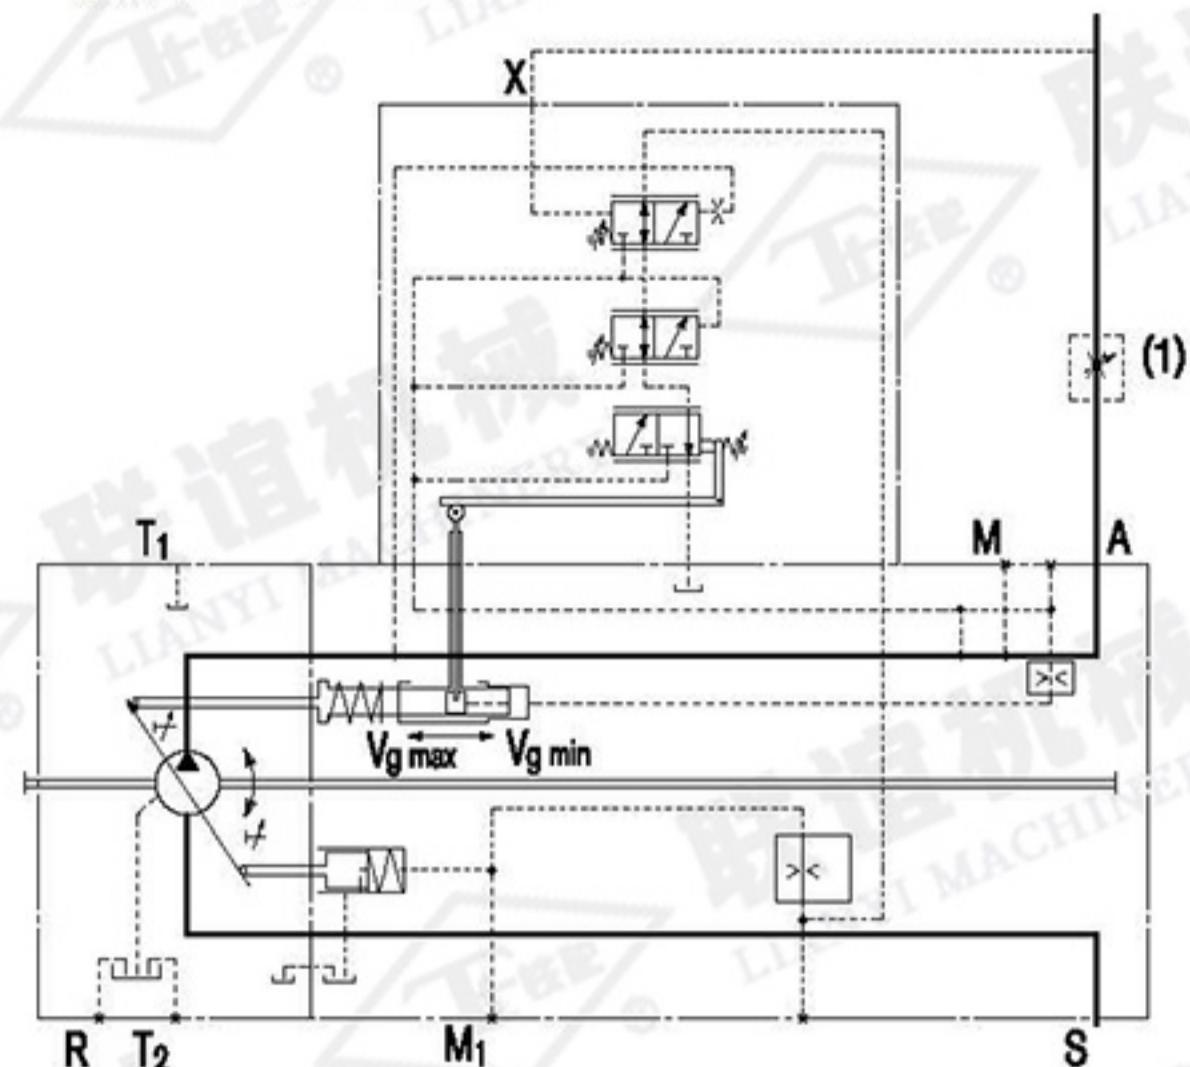

在标准 LS 系统中，压力切断装置集成在泵控制器中。在UDV(流量共用)系统中，压力切断装置内置在LUDV控制模块中。

In a standard LS system the pressure cut-off is integrated in the pump control. In a LUDV (flow sharing) system the pressure cut-off is integrated in the LUDV control block.

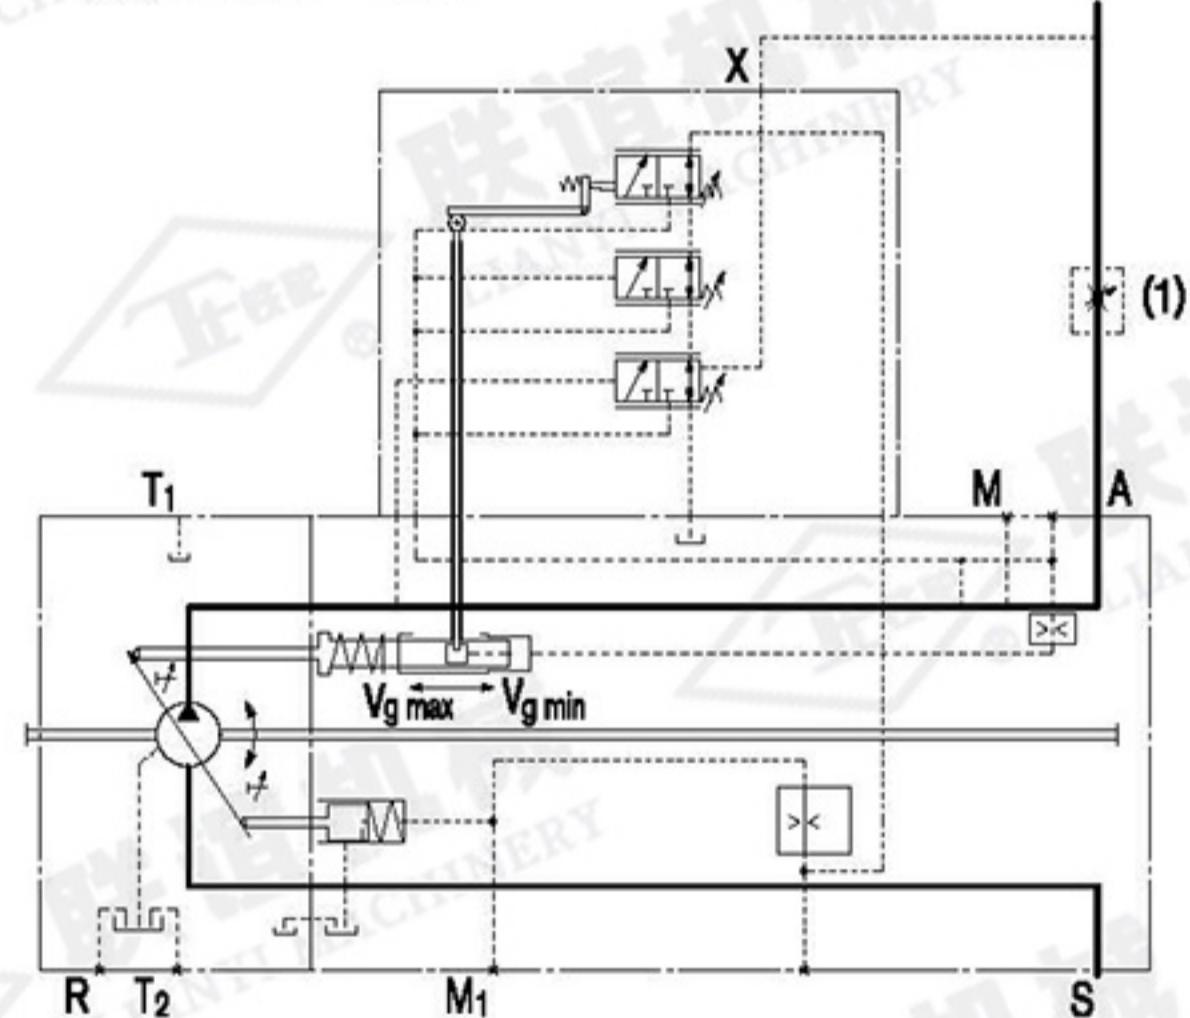

(1) 感应节流孔(控制块)不在泵供应范围内。

(1) The sensing orifice (control block) is not included in the pump supply.

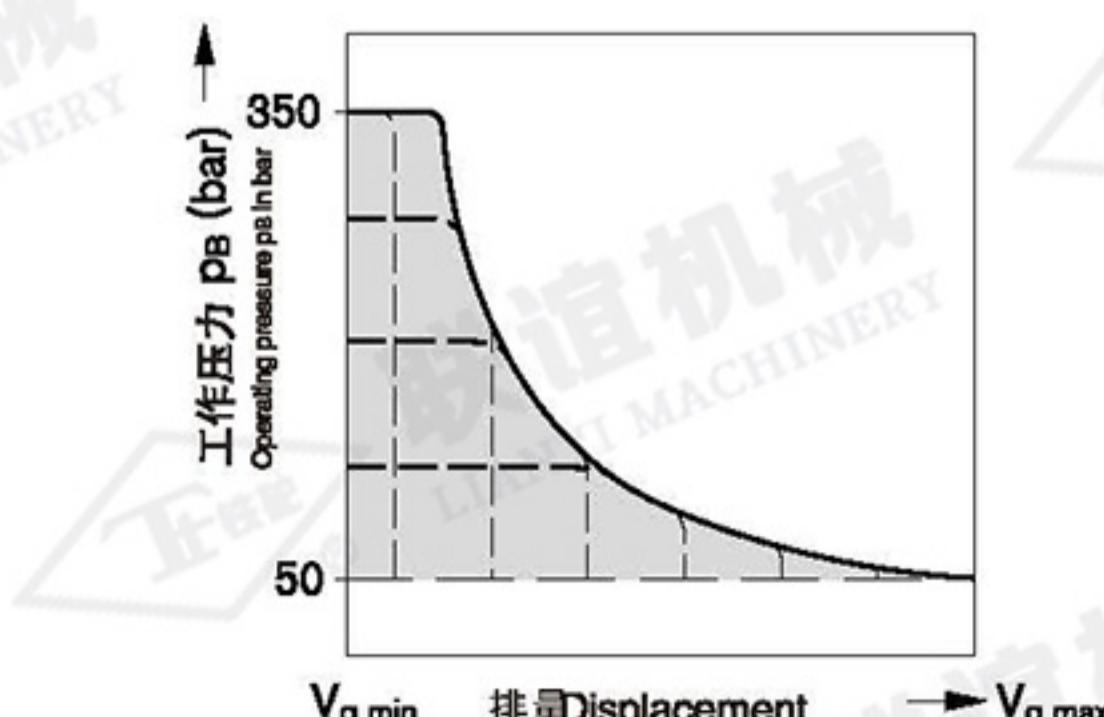

LR油路图 Circuit diagram LR
规格 Size 40……145

规格 Size 90……260

特性 LRDS Characteristic LRDS

LR- 功率控制 Power Control

LR... 带行程限位器的功率控制

Power control with stroke limiter

行程限位器可用于在整个控制范围内连续改变或限制泵排量。排量使用作用至油口 Y 的先导压力 p_{st} (最大 40 bar) 在 LRH 中或通过作用至比例电磁铁的控制电流在 LRU 中设置。需要 12 V (U1) 或 24 V (U2) 的直流电来控制比例电磁铁。The stroke limiter can be used to vary or limit the displacement of the pump continuously over the whole control range. The displacement is set in LRH with the pilot pressure p_{st} (max. 40 bar) applied to port Y or in LRU by the control current applied to the proportional solenoid. A DC current of 12V (U1) or 24V (U2) is required to control the proportional solenoid.

功率控制超越行程限位器控制进行越权控制，即低于双曲线功率特性时，排量由控制电流或先导压力控制。当设置流量或负载压力超过功率特性时，功率控制越权控制并遵循双曲线特性减小排量。

The power control overrides the stroke limiter control, i.e. below the hyperbolic power characteristic, the displacement is controlled by the control current or pilot pressure. When exceeding the power characteristic with a set flow or load pressure, the power control overrides and reduces the displacement following the hyperbolic characteristic.

为了允许泵排量控制从其起始位置 $V_{g,max}$ 到 $V_{g,min}$ 操作，电子行程限位器 LRU1/2 和液压行程限位器 LRH2/6 需要 30 bar 的最小控制压力。

To permit operation of the pump displacement control from its starting position $V_{g,max}$ to $V_{g,min}$, a minimum control pressure of 30 bar is required for the electric stroke limiter LRU1/2 and the hydraulic stroke limiter LRH2/6.

所需控制压力来自负载压力或外部施加给 G 油口的控制压力。The required control pressure is taken either from the load pressure, or from the externally applied control pressure at the G port.

为了确保在低工作压力下行程限位器也能工作，必须为油口 G 提供大约 30 bar 的外部控制压力。To ensure functioning of the stroke limiter even at low operating pressure, port G must be supplied with external control pressure of approx. 30 bar.

注意 Note:

如果没有在 G 处连接外部控制压力，应该拆卸梭阀。
If no external control pressure is connected at G, the shuttle valve must be removed.

注意 Note:

控制器中的弹簧复位装置并非安全设备

The spring return feature in the controller is not a safety device

控制器中的滑阀可能会被内部异物 (液压油杂质、系统组件磨损或沉积物) 卡在不确定位置。从而，轴向柱塞元件无法再供应操作员指定的流量。

The spool valve inside the controller can get stuck in an undefined position by internal contamination (contaminated hydraulic fluid, abrasion or residual contamination from system components). As a result, the axial piston unit can no longer supply the flow specified by the operator.

检查是否需要在您的机器上采取补救措施，以将驱动执行器移至安全位置 (如紧急停机)。

Check whether your application requires that remedial measures be taken on your machine in order to bring the driven consumer into a safe position (e.g. immediate stop).

DR – 压力控制 Pressure Control

即使在流量变化情况下，压力控制也能在其控制范围内保持液压系统内的压力稳定。变量泵只提供执行器所需的液压油。如果工作压力超过在内置压力控制阀中设置的设定点，泵排量自动摆回，直到压力偏差得到校正。

The pressure control keeps the pressure in a hydraulic system constant within its control range even under varying flow conditions. The variable pump only moves as much hydraulic fluid as is required by the actuators. If the operating pressure exceeds the setpoint set at the integral pressure control valve, the pump displacement is automatically swivelled back until the pressure deviation is corrected.

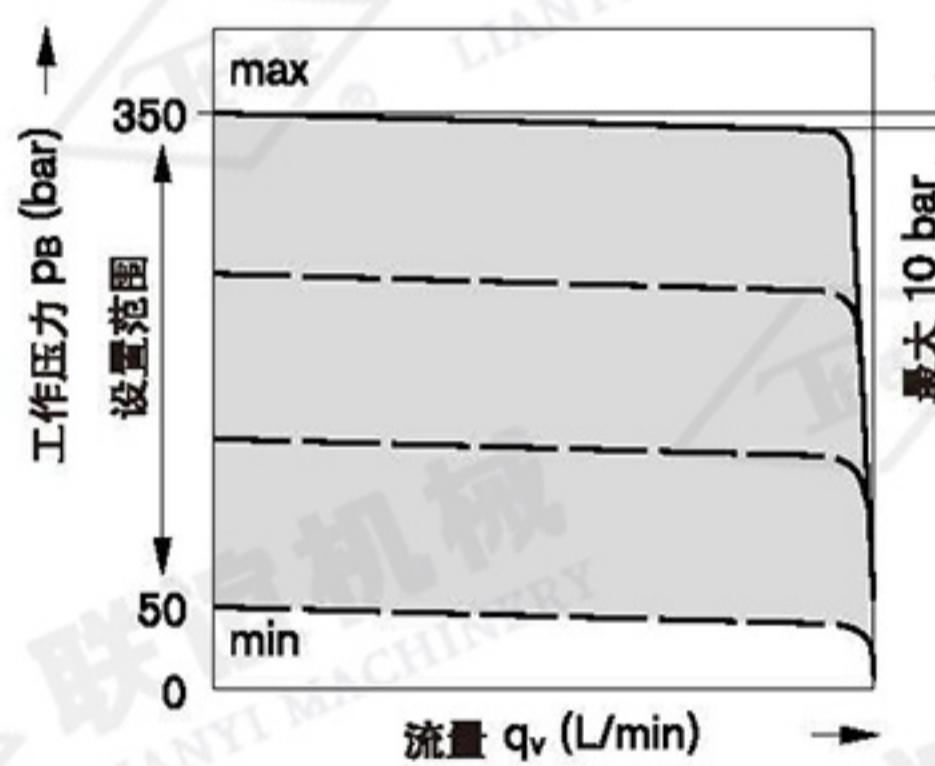

卸压状态的起始位置： $V_g \text{ max}$

Starting position in depressurized state: $V_g \text{ max}$

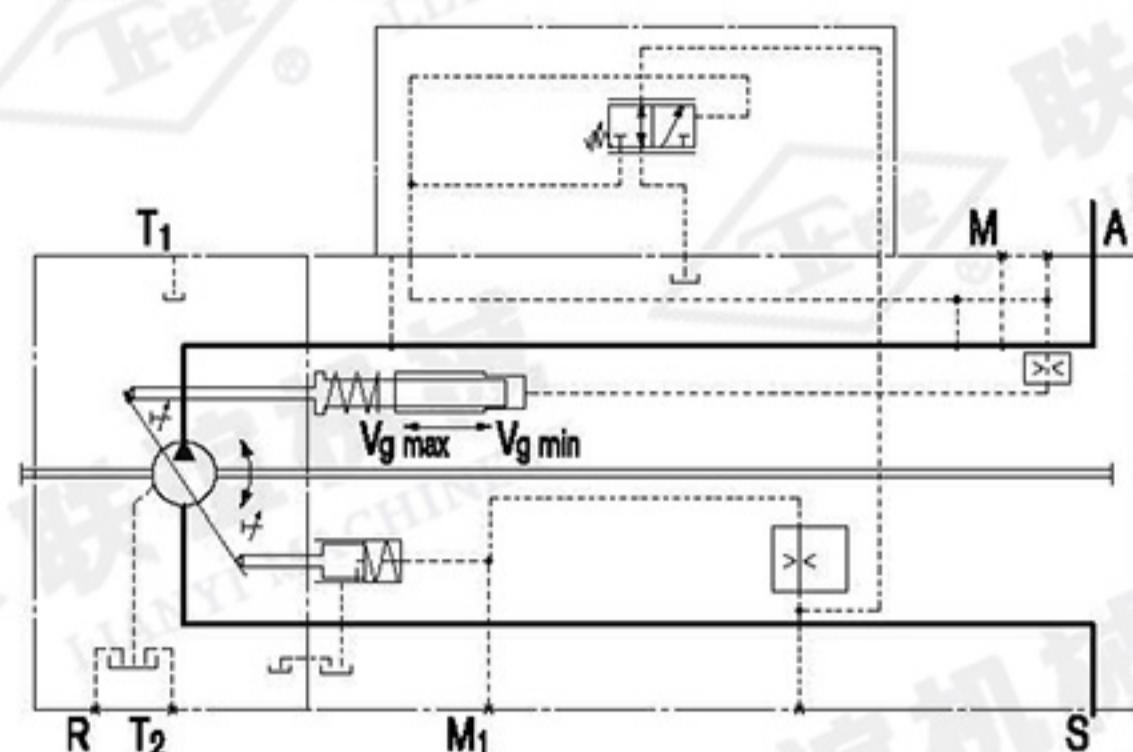

设置范围从 50 到 350 bar。

Setting range from 50 to 350 bar.

DR- 功率控制 Power Control

DRS 带负载感应的压力控制

DRS Pressure control with load sensing

负载感应控制器是一个作为负载压力函数运行的流量控制元件，以根据执行机构流量需求调节泵排量。

The load sensing control is a flow control option that operates as a function of the load pressure to regulate the pump displacement to match the actuator flow requirement.

该流量取决于安装在泵出口和执行机构之间的外部感应节流孔(1)的横截面。该流量与低于压力切断设置以及泵控制范围内的负载压力无关。

The flow depends here on the cross section of the external sensing orifice (1) fitted between the pump outlet and the actuator. The flow is independent of the load pressure below the pressure cut-off setting and within the control range of the pump.

感应节流孔通常为一个单独布置的负载感应方向阀(控制块)方向阀活塞的位置决定了感应节流孔的开口横截面，从而决定了泵的流量。

The sensing orifice is usually a separately arranged load sensing directional valve (control block). The position of the directional valve piston determines the opening cross section of the sensing orifice and thus the flow of the pump.

负载感应控制比较感应节流孔前后的压力，并维持通过孔的压降(压差 Δp)，从而使泵流量保持恒定。

The load sensing control compares pressure before and after the sensing orifice and maintains the pressure drop across the orifice (differential pressure Δp) and with it the pump flow constant.

如果感应孔处的压差 Δp 增大，泵则转回(朝向 $V_{g \min}$)，而如果压差 Δp 减小，则泵转出(朝向 $V_{g \max}$)，直到阀内感应孔上的压降恢复。

If the differential pressure Δp increases at the sensing orifice, the pump is swivelled back (towards $V_{g \min}$), and, if the differential pressure Δp decreases, the pump is swivelled out (towards $V_{g \max}$) until the pressure drop across the sensing orifice in the valve is restored.

$$\Delta p_{\text{孔}} = p_{\text{孔}} - p_{\text{执行器}} \quad \Delta p_{\text{孔口}} = p_{\text{泵}} - p_{\text{执行器}}$$

Δp 的设置范围在 14 bar 和 25 bar 之间。

The setting range for Δp is between 14 bar and 25 bar.

标准压差设置为 18 bar。(订购时，请以明文形式注明)。

The standard differential pressure setting is 18 bar. (Please state in clear text when ordering).

零行程运行(感应节流孔堵上)时的备用压力略高于 Δp 设置值。

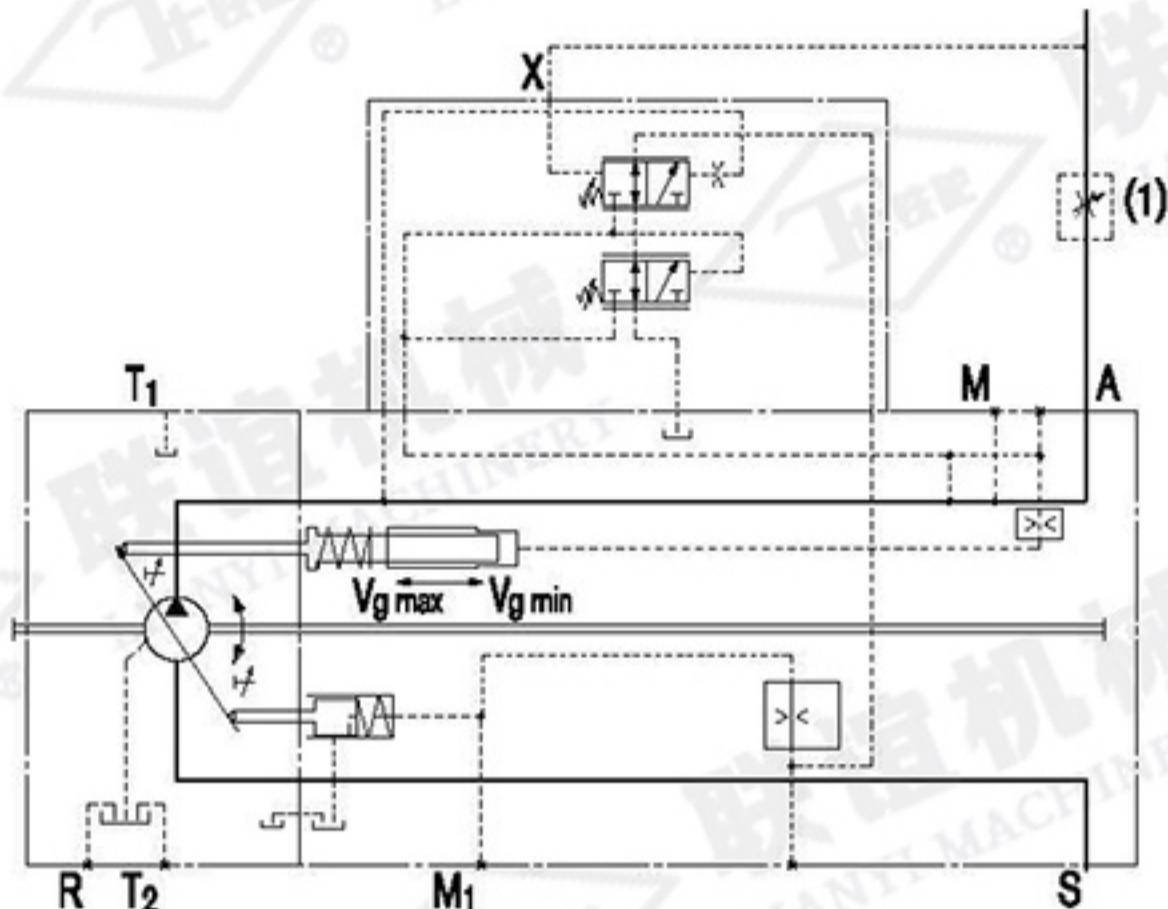

The stand-by pressure in zero stroke operation (sensing orifice plugged) is slightly above the Δp setting.

(1) 感应节流孔(控制块)不在泵供应范围内。

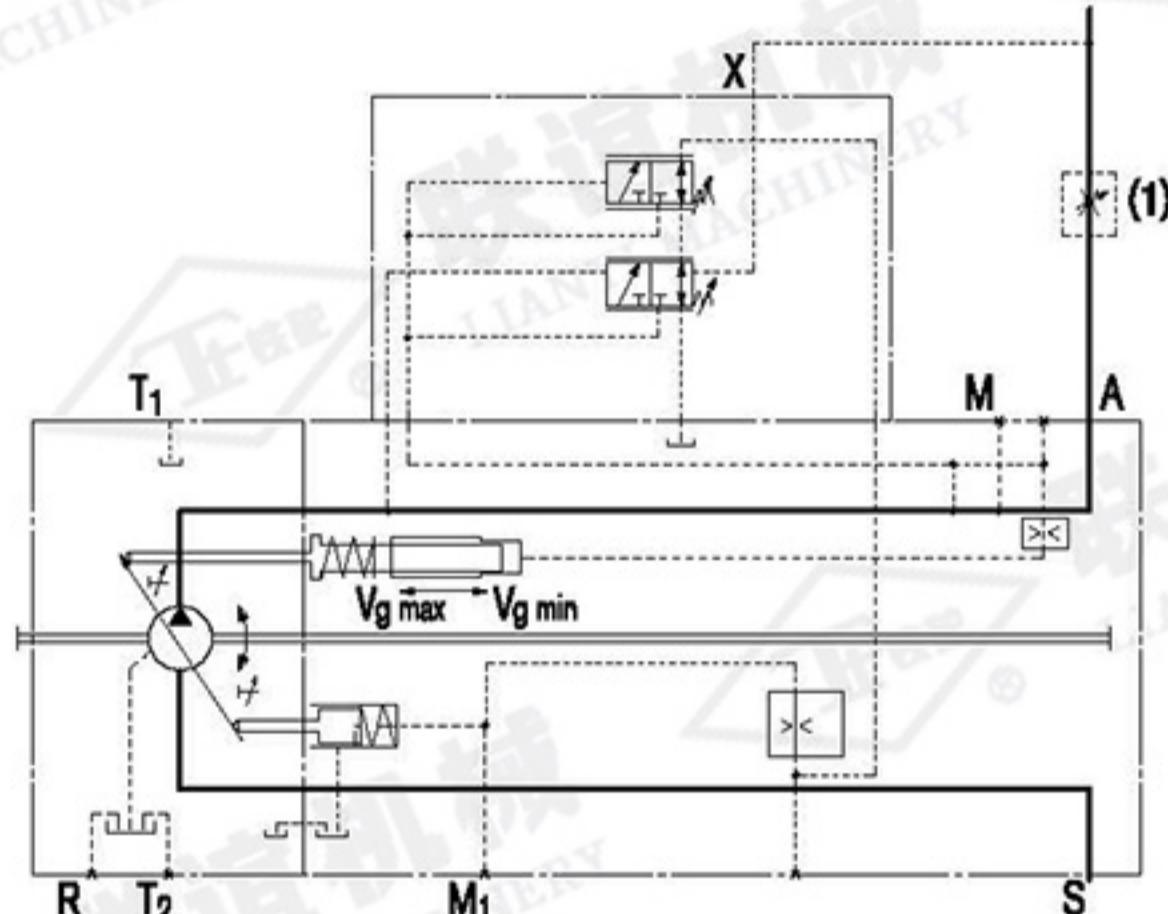

(1) The sensing orifice (control block) is not included in the pump supply.

LR油路图 Circuit diagram LR

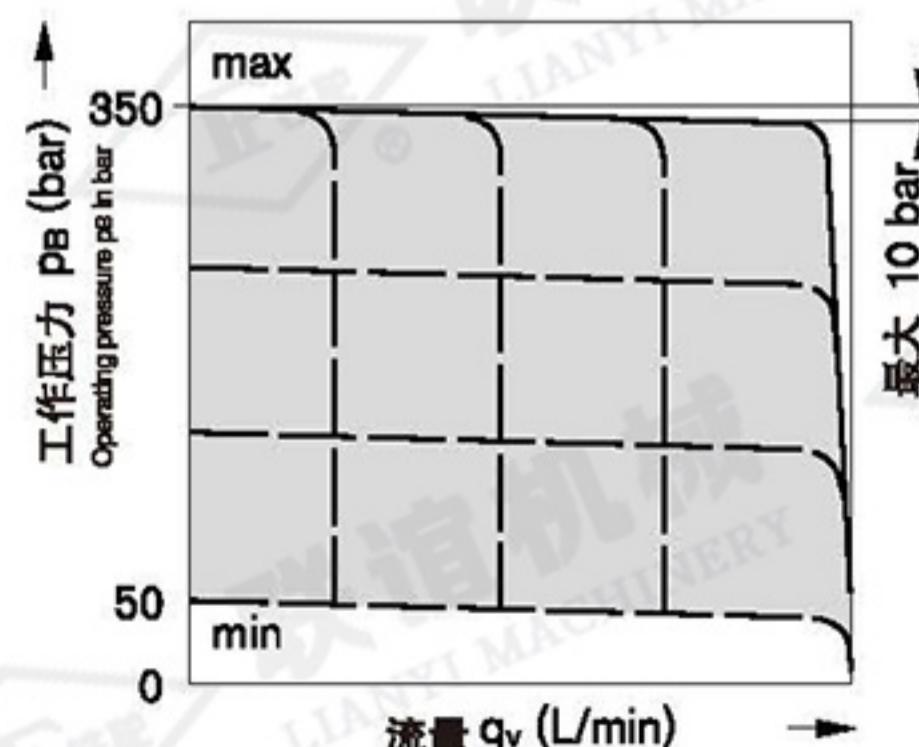

规格 Size 40……145

规格 Size 190……260

特性: DRS Characteristic DRS

DR – 压力控制 Pressure Control

DRG 远程压力控制

DRG Pressure control, remote controlled

远程控制压力切断调节器可以通过远程安装的压力阀(1)调节压力设置。此阀的先导流量通过控制模块中的固定节流孔提供。

The remote control pressure cut-off regulator permits the adjustment of the pressure setting by a remotely installed pressure relief valve (1). Pilot flow for this valve is provided by a fixed orifice in the control module.

设置范围从 50 到 350 bar。

Setting range from 50 to 350 bar.

此外，通过外部安装的 2/2 路方向阀(2)可以将泵卸载到备用压力状态。

In addition the pump can be unloaded into a standby pressure condition by an externally installed 2/2-way directional valve (2).

两个功能可以单独使用或组合使用(参见油路图)。

Both functions can be used individually or in combination (see circuit diagram).

外部阀没有随泵一起供应。

The external valves are not included in the pump supply.

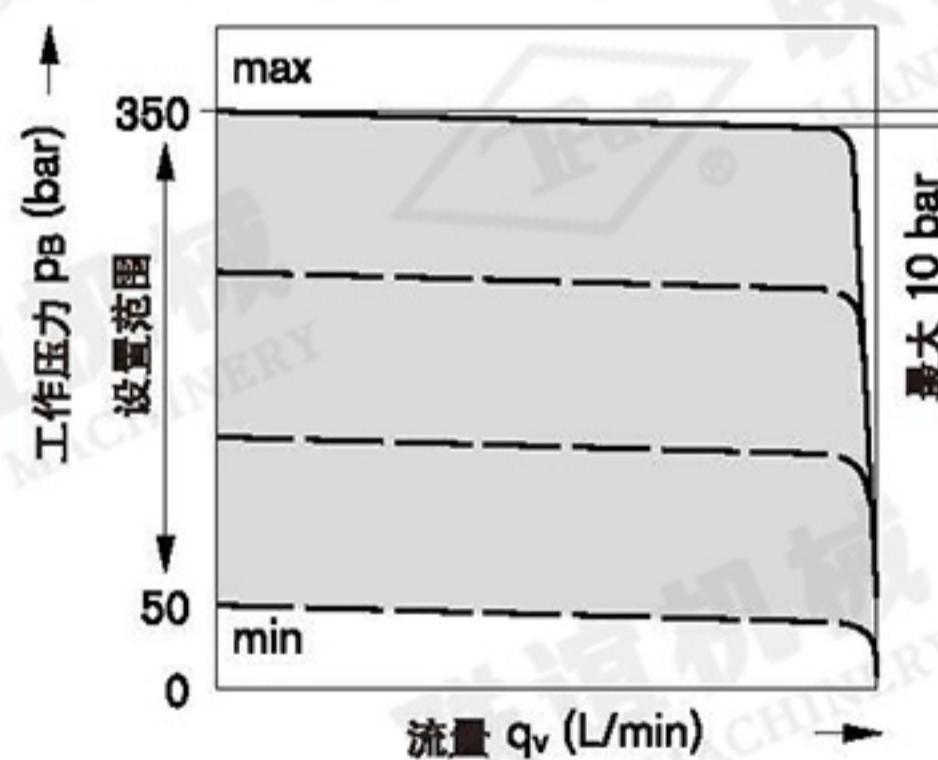

作为独立的压力阀(1)，我们推荐：

DBDH 6 (手动控制)，参见 RC 25402

As a separate pressure relief valve (1) we recommend:

DBDH 6 (manual control), see RE 25402

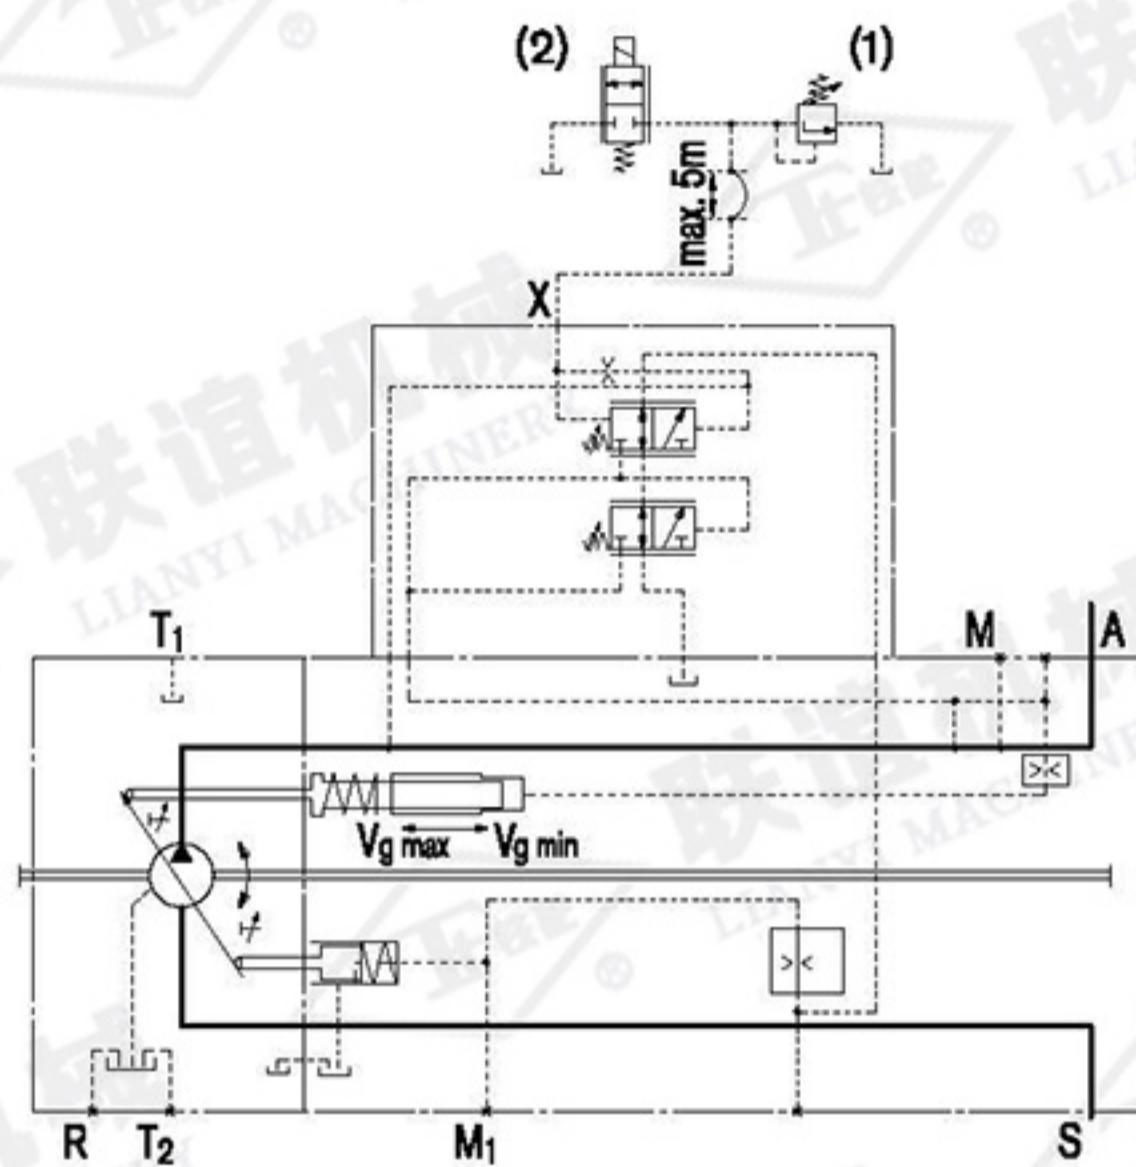

特性：DRG Characteristic: DRG

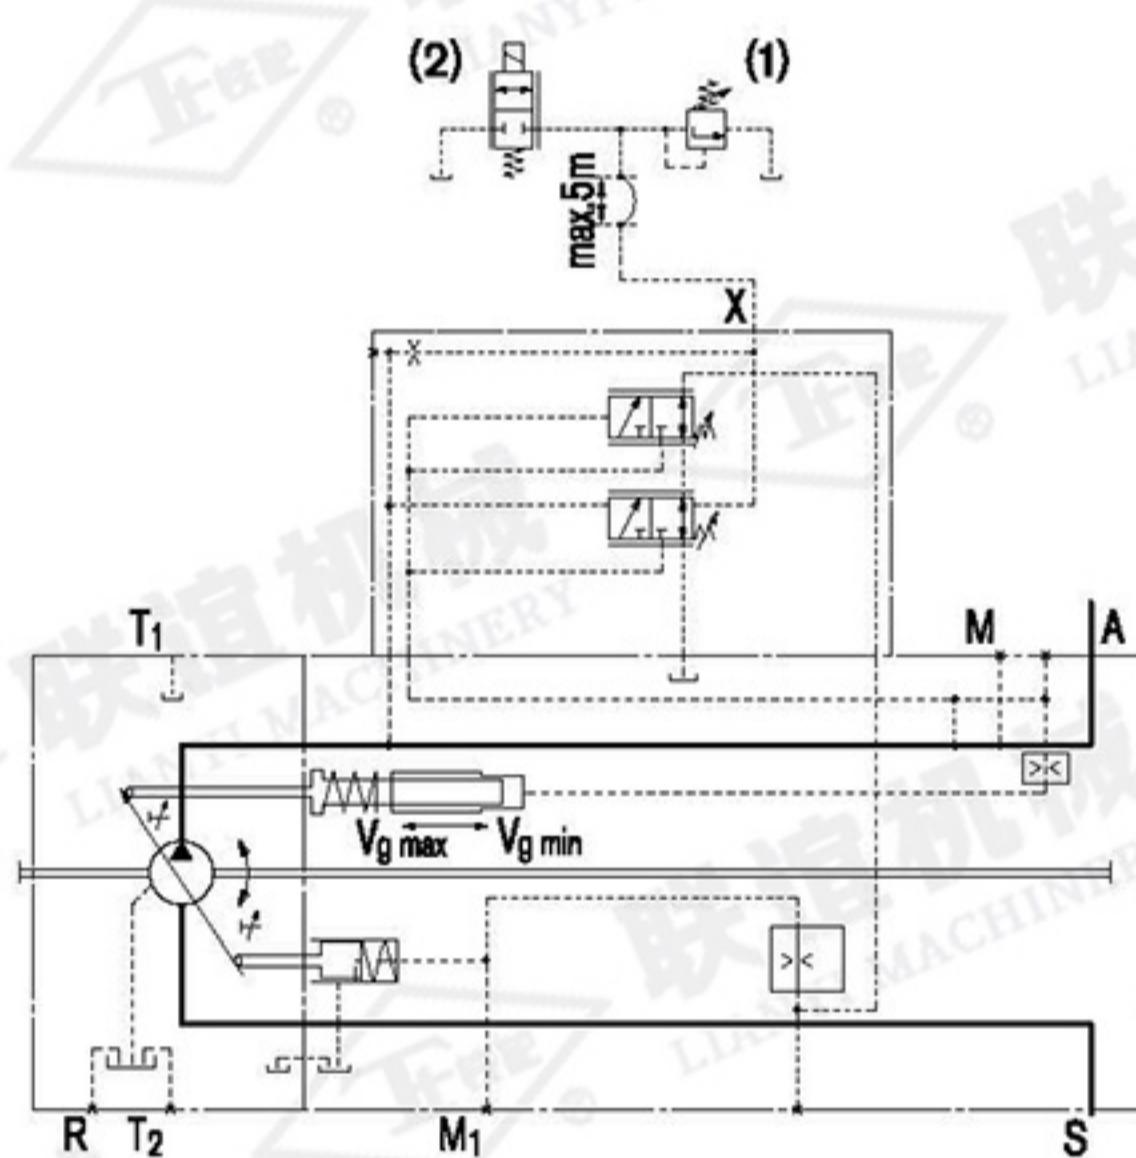

注意：远程控制压力切断也可以与 LR、HD 和 EP 组合。

Note: The remote controlled pressure cut-off is also possible in combination with LR, HD and EP.

规格 Size 190……260

EP – 带比例电磁铁的电气控制

EP – Electric Control with Proportional Solenoid

通过带有比例电磁铁的电子控制，与电磁铁电流成比例调节泵排量，从而产生磁控制力，直接作用到先导泵控制柱塞的控制阀心上。

With the electric control with proportional solenoid, the pump displacement is adjusted proportionally to the solenoid current, resulting in a magnetic control force, acting directly onto the control spool that pilots the pump control piston.

从 $V_g \text{ min}$ 至 $V_g \text{ max}$ 的控制 Control from $V_g \text{ min}$ to $V_g \text{ max}$

随着控制电流的增加，泵调节至较大排量。

With increasing control current the pump swivels to a higher displacement.

不带控制信号的起始位置(控制电流):

- 在工作压力和外部控制压力 < 30 bar 时: $V_g \text{ max}$

- 在工作压力或外部控制压力 > 30 bar 时: $V_g \text{ min}$

Starting position without control signal (control current):

- at operating pressure and external control pressure < 30 bar: $V_g \text{ max}$

- at operating pressure or external control pressure > 30 bar: $V_g \text{ min}$

将泵从其初始位置 $V_g \text{ max}$ 移至 $V_g \text{ min}$ 需要 30 bar 的控制压力。

A control pressure of 30 bar is required to swivel the pump from its starting position $V_g \text{ max}$ to $V_g \text{ min}$.

所需控制压力来自负载压力或外部施加给 G 油口的控制压力。为了确保即使在低工作压力(< 30 bar)下也可进行控制，必须对油口 G 施加约 30 bar 的外部控制压力。

The required control pressure is taken either from the load pressure, or from the externally applied control pressure at port G. To ensure the control even at low operating pressure < 30 bar the port G must be supplied with an external control pressure of approx. 30 bar.

注意 Note:

如果在 G 没有连接外部控制压力，应该拆卸梭阀。

If no external control pressure is connected at G, the shuttle valve must be removed.

注意 Note:

只有当使用矿物质液压油和油箱中的油温为最大 80°C 时才能在油箱中安装带有 EP 控制的泵。

Install pump with EP control in the oil tank only when using mineral hydraulic oils and an oil temperature in the tank of max. 80°C.

提供下列电子控制单元和放大器来启动比例电磁铁(也可参见 www.boschrexroth.com/mobilelektronik):

The following electronic control units and amplifiers are available for actuating the proportional solenoids (see also www.boschrexroth.com/mobilelektronik):

启动时间 Actuated time	100%	100%

EP-带比例电磁铁的电气控制

EP - Electric Control with Proportional Solenoid

EP.D 带有压力切断的电子控制

EP.D Electric control with pressure cut-off

当达到压力设置时，压力切断对应将泵排量调节回 $V_g \text{ min}$ 的压力控制。

The pressure cut-off corresponds to a pressure control which adjusts the pump displacement back to $V_g \text{ min}$ when the pressure setting is reached.

该功能越权控制 EP 控制，即与排量控制有关的控制电流在低于设置压力下工作。

This function overrides the EP control, i.e. the control current related displacement control is functional below the pressure setting.

压力切断阀集成在控制壳体中，并在出厂前设置至固定的规定压力值。

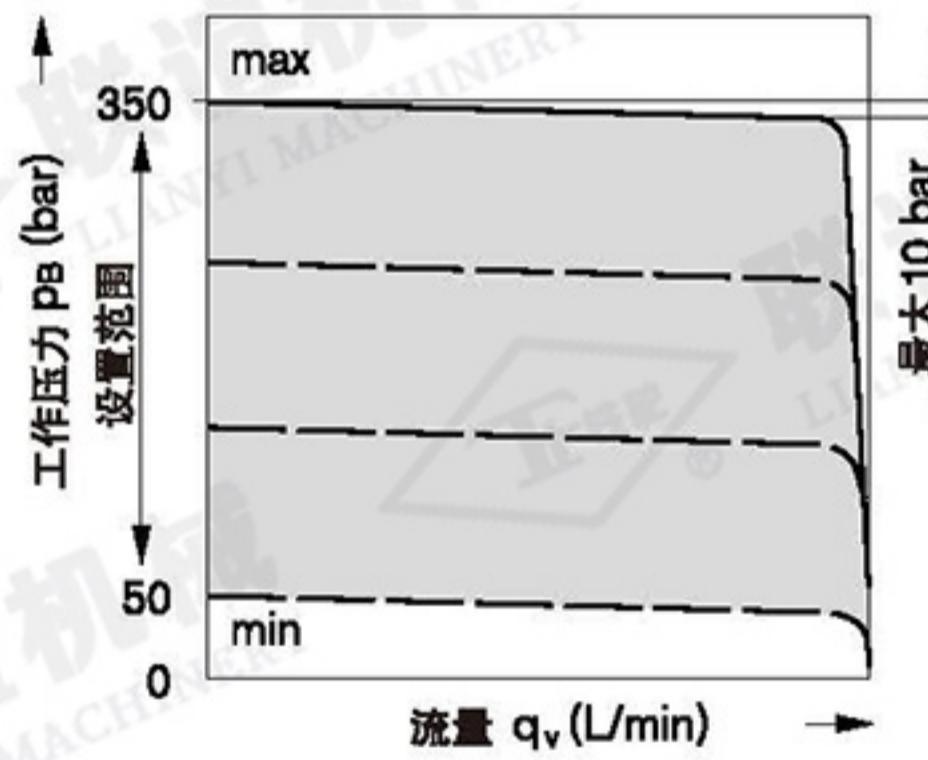

The valve for the pressure cut-off is integrated in the control case and is set to a fixed specified pressure value at the factory.

设置范围从 50 到 350 bar

Setting range from 50 to 350 bar

1) 当使用用于连接泵(二泵)的 Z 轴(花键轴 DIN 5480)时

1) When using the Z shaft (splined shaft DIN 5480) for the attached pump (2nd pump)

2) 带有加注泵的型号 Version with charge pump

当订购组合泵时，

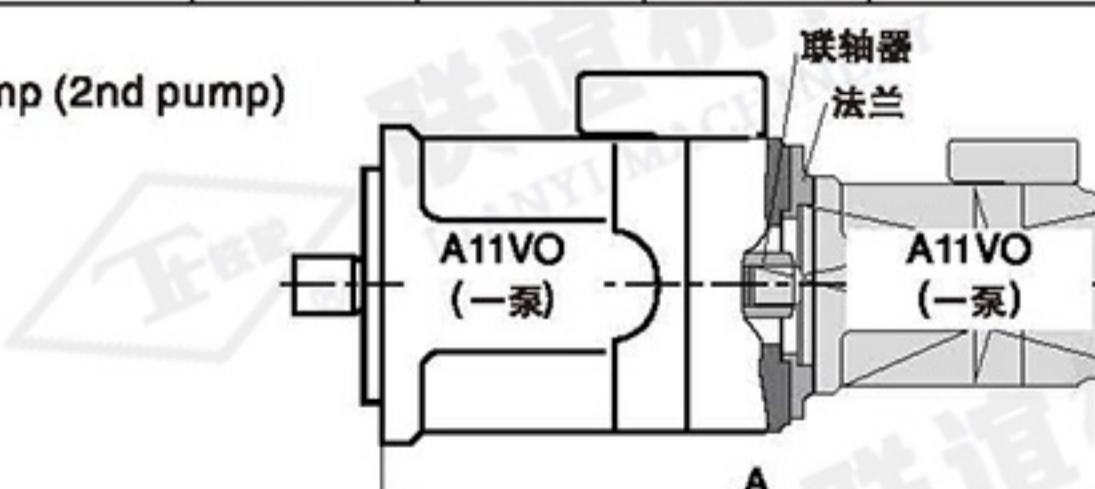

一泵和二泵的型号名称必须用“+”连接。

一泵订货代码 + 二泵订货代码

When ordering combination pumps, the type designations of the 1st and 2nd pumps must be connected by a “+”.

Ordering code 1st pump + Ordering code 2nd pump

订货示例 Ordering example: A11VO130LRDS/10R-NZD12K61 + A11VO60LRDS/10R-NZC12N00

安装注意事项 Installation Notes

安全说明 General

在调试和运行过程中，轴向柱塞元件必须始终充满液压油并排放空气。在停用时间相对较长时，也应遵守上述注意事项，因为系统可能通过液压管路排空。

During commissioning and operation, the axial piston unit must be filled with hydraulic fluid and air bled. This is also to be observed following a relatively long standstill as the system may empty via the hydraulic lines.

外壳内的壳体泄油必须通过最高油箱油口 (T1、T2) 排放到油箱。油口 S 处的最小吸入压力不得降低到 0.8 bar 绝对压力 (不带加注泵) 或 0.6 bar (带有加注泵) 以下。

The case drain in the case interior must be directed to the tank via the highest tank port (T1, T2). The minimum suction pressure at port S must not fall below 0.8 bar absolute (without charge pump) or 0.6 bar (with charge pump).

在所有工况下，吸油管路和壳体泄油管路必须通入油箱中最低油位以下的位置。

In all operational conditions, the suction line and case drain line must flow into the tank below the minimum fluid level.

安装位置 Installation position

请参见以下示例。其它安装位置可应要求提供。

See examples below. Additional installation positions are available upon request.

在油箱下方安装 (标准)

泵低于油箱的最低油位。

建议的安装位置：1 和 2。

Below-tank installation (standard)

Pump below the minimum fluid level of the tank.

Recommended installation positions: 1 and 2.

在油箱上方安装

泵高于油箱的最低油位。

遵守最大允许吸油高度

$h_{s \max} = 800 \text{ mm}$

型号 A11VLO (带有加注泵) 不是为安装在油箱上方而设计。

安装位置 7 建议 (轴朝上): 箱体泄油管路中的单向阀 (开启压力 0.5 bar) 可以防止壳体内部排放。

对于带有压力控制、排量限制器、HD 和 EP 控制的控制选装件，最小排量设置必须为 $V_g \geq 5\% V_{g \max}$ 。

Above-tank installation

Pump above the minimum fluid level of the tank.

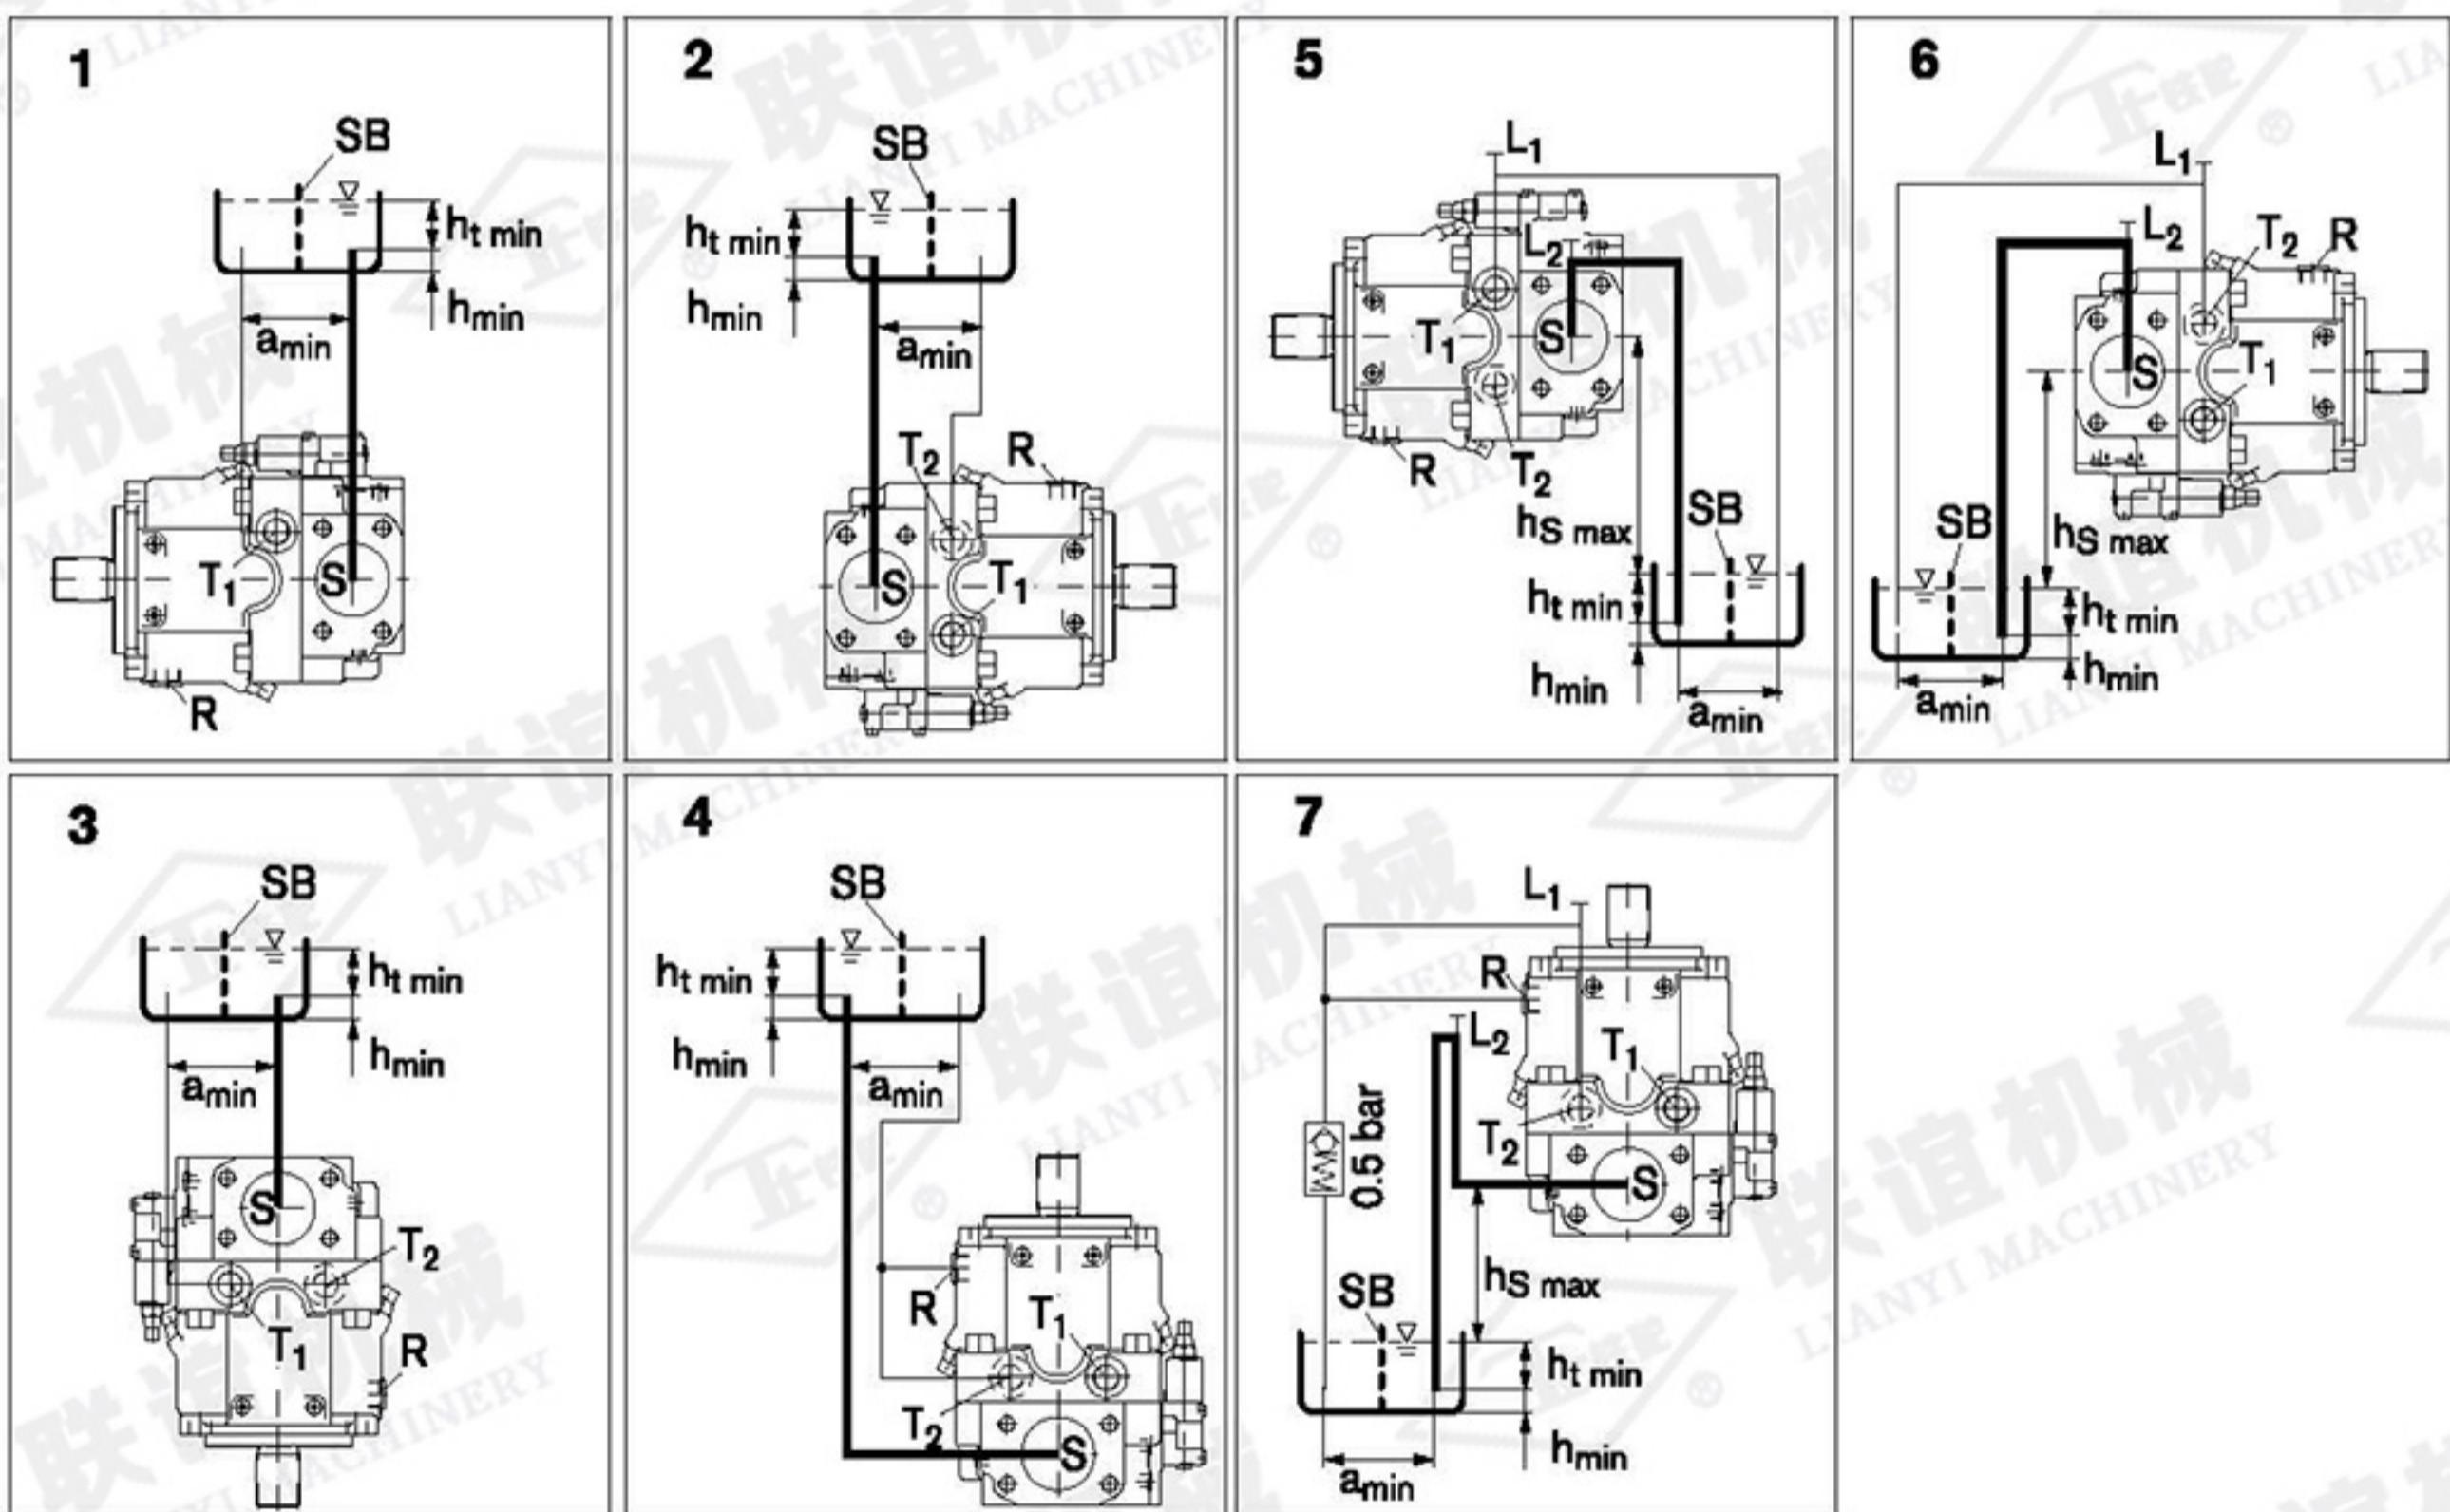

Observe the maximum permissible suction height

$h_{s \max} = 800 \text{ mm}$

The version A11VLO (with charge pump) is not designed for installation above the tank.

Recommendation for installation position 7 (shaft up): A check valve in the case drain line (opening pressure 0.5 bar) can prevent the case interior from draining.

For control options with pressure control, displacement limiters, HD and EP control, the minimum displacement setting must be $V_g \geq 5\% V_{g \max}$.

$h_{s\max} = 800 \text{ mm}$ 、 $h_{t\min} = 200 \text{ mm}$ 、 $h_{\min} = 100 \text{ mm}$ 、SB = 消声器板 (挡板) Silencer plate (baffle plate)

当设计油箱时，确保吸油管路和箱体泄油管路之间有足够的空间 a_{\min} ，以防经过加热的回流液压油被直接从后面吸出。

When designing the tank, ensure adequate space a_{\min} between the suction line and the case drain line to prevent the heated, returned fluid from being directly drawn back out.

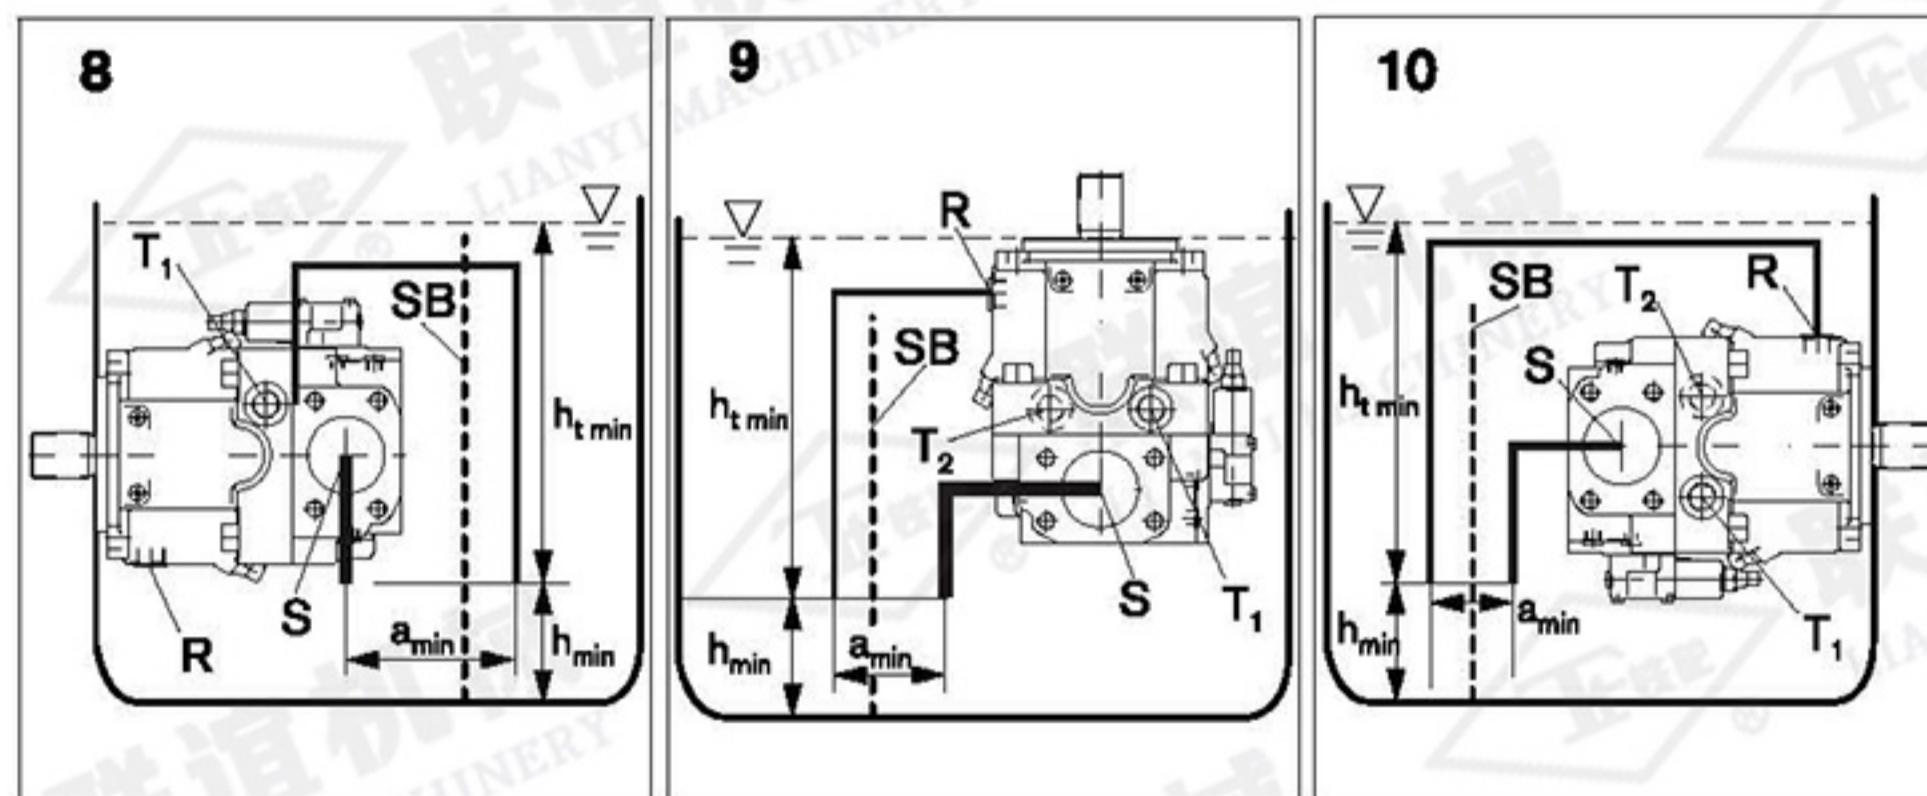

安装位置 Installation position	排气 Air bleeding	注油 Filling
1	T ₁	S + T ₁
2	R	S + T ₂

安全说明 General Notes

A11VO 泵设计用于开式回路中。The A11VO pump is designed to be used in open circuits.

轴向柱塞元件的项目规划、组装和调试必须由合格人员进行。

Project planning, assembly and commissioning of the axial piston unit require the involvement of qualified personnel.

工作管路油口和功能油口仅设计用于液压管路。The service line ports and function ports are only designed to accommodate hydraulic lines.

运行期间及运行后不久，轴向柱塞元件(特别是电磁铁)可能存在造成灼伤的风险。应采取适当的安全措施(例如穿着防护服)。

During and shortly after operation, there is a risk of burns on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e. g. by wearing protective clothing).

根据轴向柱塞元件的不同工作状态(工作压力、油液温度)，特性可能会改变。

Depending on the operational state of the axial piston unit (operating pressure, fluid temperature), the characteristic may shift.

压力油口 Pressure ports:

油口和固定螺纹设计用于最大规定压力。机器或系统制造商必须确保连接元件和管路的安全系数满足规定的工作条件(压力、流量、液压油、温度)。

The ports and fixing threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified operating conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.

此处包含的数据和说明必须遵循。The data and notes contained herein must be adhered to.

采用以下紧固扭矩 The following tightening torques apply:

轴向柱塞元件的螺纹孔 Threaded hole for axial piston unit:

最大允许紧固扭矩 $M_{G\max}$ 对于螺纹孔是最大值，不得超过该值。有关数值，请参见下表。

The maximum permissible tightening torques $M_{G\max}$ are maximum values for the threaded holes and must not be exceeded. For values, see the following table.

接头 Fittings:

关于所用接头的紧固扭矩，请参见制造商说明。

Observe the manufacturer's instruction regarding the tightening torques of the used fittings.

固定螺钉 Fixing screws:

有关满足 DIN 13 的固定螺钉，我们建议根据 VDI 2230 对其紧固扭矩进行单独检查。

For fixing screws according to DIN 13, we recommend checking the tightening torque individually according to VDI 2230.

锁紧螺钉 Locking screws:

对于轴向柱塞元件附带提供的金属锁紧螺钉，施加锁紧螺钉所需的紧固扭矩 M_V 。有关数值，请参见下表。

For the metal locking screws supplied with the axial piston unit, the required tightening torques of locking screws M_V apply. For values, see the following table.

该产品部件没有按照 DIN EN ISO 13849 的通用机器安全概念进行认证批准。

The product is not approved as a component for the safety concept of a general machine according to DIN EN ISO 13849.

螺纹尺寸 Thread size		螺纹的最大允许紧固扭矩 Max. permissible tightening torque of the screw thread $M_{G\max}$	锁紧螺钉所需的紧固扭矩 Required tightening torque for locking screws M_V	WAF 内六角 Hexagon socket
M12x1.5	DIN 3852	50 Nm	25 Nm	6 mm
